

Kotak Broker Login Flow

Architecture Overview

[See .md file for architecture diagram]

Prerequisites

Item	Where	Example
Consumer Key	<code>`.env` `KOTAK_CONSUMER_KEY`</code>	<code>`abc123...`</code>
Consumer Secret	<code>`.env` `KOTAK_CONSUMER_SECR`</code>	Optional
Mobile Number	<code>`.env` `KOTAK_MOBILE`</code>	<code>`9876543210`</code>
UCC	<code>`.env` `KOTAK_UCC`</code>	<code>`ABC123`</code>
MPIN	<code>`.env` `KOTAK_MPIN`</code>	<code>`1234`</code> (numeric only)
TOTP/OTP	<code>`.env` `KOTAK_OTP`</code> or from	Changes every 30s

Step-by-Step Process

1 Start Backend Server

```
py -m uvicorn app.main:app --reload --port 8000
```

[IMPORTANT]
Backend MUST be running before any login attempt. All login happens via API calls.

2 Login (Two Options)

- Option A Manual Login (Recommended)
- Open frontend Click "Connect Broker" in header
 - Enter: Mobile, UCC, TOTP, Consumer Key Submit (Step 1)
 - Enter: MPIN (numeric) Submit (Step 2)
- Option B Auto-Login
- Put fresh TOTP in .env Start server It auto-logs in during `startup_event()`
 - TOTP expires in 30s, so timing is tricky

3 After Login Succeeds

Three things happen automatically:

What	Effect
<code>`auth_manager.client`</code> is set	All broker APIs (quotes, hol
<code>`MarketDataService`</code> starts	WebSocket connects, live tic
<code>`kotak_service.is_logged_in`</code>	Chart data fetched from Kota

4 Trigger Instrument Master Sync

After login, trigger this to load all 80,000+ instruments:

```
POST http://localhost:8000/api/v1/admin/refresh-instruments
```

Key Files

File	Role
auth_manager.py	Orchestrates login, holds `c`
otp_login.py	Implements 2-step OTP strate
kotak_service.py	Makes actual HTTP calls to K
main.py	Login API endpoints + startu
service.py	WebSocket connection after l
